

Frozen String Syntax

Feature #8579

```
$ ruby --dump=insns -e '"hello world"'
== disasm: <RubyVM::InstructionSequence:<main>@-e>=====
0000 trace          1                                ( 1)
0002 putstring      "hello world"
0004 leave
```

Dups new object every time.
Creates a lot of garbage objects.

```
$ ruby --dump=insns -e '%f(hello world)'
== disasm: <RubyVM::InstructionSequence:<main>@-e>=====
0000 trace          1                                ( 1)
0002 putobject      "hello world"
0004 leave
```

Reuses same frozen string object every time.
Avoids creating many garbage objects.

%f(single quoted)

- No interpolation
- Reuses same frozen object
- Can be deduplicated across whole program

%F(double #{:quoted})

- Allows interpolation
- Creates new object each time
- Returns a frozen string
- Same as “double #{:quoted}”.freeze
