Add Set#=== as an alias for Set#include? so that sets may be used in case statements:

```ruby
require 'set'
GOOD_COMMANDS = Set[ :foo, :bar, :jim ]
BAD_COMMANDS = Set[ :baz, :bax, :jam ]
ODD_COMMANDS = Set[ :quux, :xyzzy ]

case my_command
  when GOOD_COMMANDS then puts "Yay!"
  when BAD_COMMANDS then puts "Boo!"
  when ODD_COMMANDS then puts "Whaa?"
end
```

And one-time splatting would be also more efficient than calling include? each time.

This was added in Ruby 2.5, so I think this issue can be closed.
