Ruby loses readline standard library when the system doesn't have libreadline during Ruby installation, At https://bugs.ruby-lang.org/issues/11084, hsbt (Hiroshi SHIBATA) proposed pure Ruby implementation. But I think that rb-readline is not good for Ruby standard library and I described it at http://blade.nagaokaut.ac.jp/cgi-bin/scat.rb/ruby/ruby-core/86213. The important reason for it personally is that rb-readline doesn't have vi mode.

So I'm implementing Reline for a new standard library as GNU Readline and existing ext/readline compatible. I can maintain it. https://github.com/aycabta/reline

I don't think that Reline should replace ext/readline fully, it's just for fallback. But it's important for Ruby.

Reline does not seem to support bracketed paste mode:
$ ruby -v
ruby 2.7.0p0 (2019-12-25 revision 647ee6f091) [x86_64-darwin18]

$ # has 2 lines of input
  pbpaste
  "abc"
  .upcase

$ # readline respects bracketed paste mode, reads in both lines
  ruby -r readline -e 'p Readline.readline ""> 
  > "abc"
  .upcase
  "\"abc\""
  .upcase

$ # reline does not support bracketed paste mode, reads them in as 2 separate lines
  ruby -r reline -e '2.times { p Reline.readline ""> 
  > "abc"
  "\"abc\"
  > .upcase
  ".upcase"

$ cat ~/.inputrc | sed '/^$/q'
set enable-bracketed-paste on
set blink-matching-paren on
set colored-completion-prefix on
set colored-stats on
set keyseq-timeout 250
set show-all-if-ambiguous on
set visible-stats on

I also checked one of the other config options (blink-matching-paren) and it blinks with readline, but not reline. Makes me wonder if it isn't reading the ~/.inputrc file (it may be Mac specific).

Reporting it here as the Github project doesn't seem to have an issues section.
