**Ruby master - Feature #15575**

**Prohibit to pass a block singleton class**

01/30/2019 07:19 AM - ko1 (Koichi Sasada)

**Description**

The following code works now:

```ruby
def foo
  class << Object.new
    yield
  end
end
```

```ruby
foo { p :ok } #=> :ok
```

but I think this feature is very strange because local variables are not active in singleton class.

How about to prohibit this feature?

plan: warning at ruby 2.7 and prohibit it in ruby 3.

**Associated revisions**

**Revision 0fc597f2 - 02/04/2019 07:10 AM - ko1 (Koichi Sasada)**

check and show a warning for incorrect yield.

- compile.c (check_yield_place): this function check the yield location.
  - show a warning if yield in class syntax. [Feature #15575]
  - do strict check for toplevel yield. Without this patch, 1.times{ yield } in toplevel is valid-syntax (raise LocalJumpError at runtime) although toplevel simple yield is not valid syntax. This patch make them syntax error.

**History**

### #1 - 01/30/2019 12:17 PM - Eregon (Benoit Daloze)
Agreed.
IMHO class << expr should be no different than the normal class Name, but currently various things are allowed in that context such as return, yield, etc.

Constant resolution also becomes somewhat dynamically-scoped with class << expr which is also a weird exception.
So longer term maybe it would be good to deprecate class << entirely and use singleton_class.class_exec do instead.

### #2 - 01/30/2019 12:24 PM - ko1 (Koichi Sasada)

or make it syntax sugre of singleton_class.class_exec do?
Both are easy to explain the rule. Now, it is somewhat unclear.

### #3 - 01/30/2019 12:27 PM - ko1 (Koichi Sasada)
Similar strange example (off-topic):

```ruby
1.times{
  class C
  break
  def undefined_method; end
  end
  p :unrechable
}
p [:ok, C.instance_methods(false)] #=> [:ok, []]
```

We can break from class syntax.
I hope nobody use it :(

### #4 - 01/30/2019 12:28 PM - Eregon (Benoit Daloze)
ko1 (Koichi Sasada) wrote:

I think that would be confusing as class (like module and def) is a keyword which normally adds a new lexical scope and does not capture the parent local variables.

At least TruffleRuby doesn't implement it, and we had no bug report about this, so hopefully not used.
Agreed it should be deprecated/removed as it's confusing at best.

### #6 - 01/31/2019 04:36 AM - alanwu (Alan Wu)
Another option would be to make everything use lexical scope, if the strangeness is indeed because locals are inaccessible inside class << self.
So imagine the following printing 1 2 3.
baz = 3
class << self
  p foo, bar, baz
end
end
A.new_hi

Is it less strange if everything used the same scoping rule?

#7 - 01/31/2019 08:02 AM - matz (Yukihiro Matsumoto)
Agreed to prohibit. Disagree to change the scoping rule (alanwu (Alan Wu)).

Matz.

#8 - 02/04/2019 06:43 AM - ko1 (Koichi Sasada)
Matz, Thank you for confirmation.
I add a warning (without -w) like that:

def foo
  class << Object.new
    yield
  end
end
foo{ p :ok } #=> :ok

    test.rb: warning: `yield' in class syntax will not be supported from Ruby 3.0. [Feature #15575]

    English correction is welcome ;)

#9 - 02/04/2019 07:10 AM - ko1 (Koichi Sasada)
    Status changed from Open to Closed

    Applied in changeset trunk|r66999.

check and show a warning for incorrect yield.

- compile.c (check_yield_place): this function check the yield location.
  - show a warning if yield in class syntax. [Feature #15575]
  - do strict check for toplevel yield. Without this patch, `1.times{ yield } in toplevel is valid-syntax (raise LocalJumpError at runtime) although toplevel simple yield is not valid syntax. This patch make them syntax error.
