### Description

I would like attr_predicate like attr_reader etc.

attr_predicate :cat would define a method named :cat? that returned the value for ivar @cat.

I would like this because i find myself writing this:

```ruby
def cat?
  @cat
end
```

which is fine once, but becomes tedious with many attributes

Another possibility is allowing attr_reader :cat? to define a method that returns the value for ivar @cat. currently it raises NameError (invalid attribute namecat?)

Thank you
