

Ruby master - Feature #2456

It is better to let user to select particular ssl protocol easily.

12/08/2009 11:50 AM - liping (liping bao)

Status:	Closed
Priority:	Normal
Assignee:	
Target version:	
Description	
<pre>=begin For example, in https module, if the client want to use tls1 protocol compulsively, it is a little harder to do it. With the following diff: /usr/lib64/ruby/1.8/net/https.rb 120d119 < flag = (flag ? true : false) 124c123 < @ssl_context = OpenSSL::SSL::SSLContext.new @ssl_context = flag == true ? OpenSSL::SSL::SSLContext.new : OpenSSL::SSL::SSLContext.new(flag)</pre>	
User could select the protocol as wish such as: http.use_ssl = :TLSv1 instead of http.use_ssl = true =end
