<p>Some research has pointed to a problem with "windows ruby not being able to handle IPv6"</p> <p>I logged an issue at Redmine issuelog and they pointed me here.</p> <p>Any idea / suggestions on how to address this issue?</p> <p>Thanks</p>

got this once "The storage control blocks were destroyed."
For me it meant "try it again your wireless is flaky" but I assume not so in your case?

Not really.. good try though... ;-)
It is a amazon cloud instance server running Windows Server 2008. I heard that Ruby on Windows is getting trouble with IPv6...
Not sure what to make of that..

If I disable IPv6 at that server, would that work or kill my rig?

Thanks

Two things:

- 1) move Redmine installation outside Program Files, path with spaces are not good for Ruby.
- 2) From the folder installation, seems you're using RubyInstaller (Ruby187). That is correct?

Can you create a simple test case of invoking imap *without* Redmine installation? In that way, we can try reproduce the issue.

The simplest test case that exposes the issue the faster we can investigate and perhaps solve the issue.
