<b>Target version:</b>	Next Major
<b>Description</b>	
<pre>=begin Hello As I looked to C++ extension suffing numeric literals. My proposal is make . in method call of numeric literal optional so we can for example write 4i instead 4.i Another application is making Time manipulations more readable like deadline=Time.now + 2hours  Here is patch It should be more restrictive to disallow traps like 0xadup Index: parse.y ===== --- parse.y (revision 29647) +++ parse.y (working copy) @@ -3592,6 +3592,16 @@ \$\$ = method_arg(dispatch1(fcall, \$1), \$2); %/ } +   numeric tIDENTIFIER opt_paren_args + { +   /%%%%/ +   \$\$ = NEW_CALL(\$1, \$2, \$3); +   fixpos(\$\$, \$1); +   /% +   \$\$ = dispatch3(call, \$1, ripper_id2sym('.'), \$2); +   \$\$ = method_optarg(\$\$, \$3); +   %/ + }   primary_value '.' operation2 opt_paren_args {   /%%%%*/ =end</pre>

My proposal is make . in method call of numeric literal optional so we can for example write
4i instead 4.i
Another application is making Time manipulations more readable like
deadline=Time.now + 2hours
```

```
activesupport already gives us stuff like
Time.now + 2.hours
```

is typing the dot really that much extra work for you?
