Ruby master - Bug #6723

Global variable scoping problem.

07/12/2012 07:50 AM - iblue (Markus Fenske)

Description

This issue exists from 1.8 to ruby-head.

See the following example:

```
def foobar
  "Foobar".match(/\+\+)/)
  puts $1.inspect
end
```

```
foobar
puts $1.inspect
puts global_variables.inspect
```

This demonstrates that $1 does not behave like a global variable. However it's listed by Kernel.global_variables as a global variable. And it's named like a global variable.

This leads to some confusion sometimes. See for example [http://stackoverflow.com/q/11441782/773690](http://stackoverflow.com/q/11441782/773690)

It may not be a good idea to fix this inconsistent naming, because it may break severaly things. However the fact that $1 and friends are not global variables should be clearly documented. And by the way: Ruby != Perl.

Or maybe make $1 a real global variable?

#4 - 07/25/2012 06:50 AM - drbrain (Eric Hodel)

These are described as "Special global variables" and are described as "thread-local and method-local" in the Regexp documentation. I updated a reference to them in re.c, but the existing documentation should be sufficient.
