Description		
=begin		
Most of the time when I use Object#singleton_class, I use it with class_eval following it, like follows:		
<pre>class Foo singleton_class.class_eval{attr_accessor :bar} end</pre>		
I think it would be convenient if Object#singleton_class can optionally take a block so that the following will mean the same as above.		
<pre>class Foo singleton_class{attr_accessor :bar} end</pre>		
=end

I'm not sure I like this, but I do agree about the use case. What about adding a method singleton_class_eval instead?
